

## Peripheral Vascular and Stroke Screening

A \$75  
test (painless,  
non-invasive)  
that could save  
your life

### ▶ What does this screening show?

This screening looks for 3 primary causes of stroke and vascular disease:

- Diminished blood flow in your **peripheral arteries**
- Buildup of fatty plaque in your **carotid arteries**
- Weakening and enlargement of the **abdominal arteries**

Often conditions in these areas have no noticeable symptoms; early detection is key to preventing a stroke or vascular disease — and could ultimately save your life.

### ▶ Who should get the screening?

Screenings are appropriate for people over age 50 with these risk factors:

- Family history of stroke
- Smoker
- High LDL cholesterol and/or low HDL cholesterol
- High blood pressure
- Overweight

You are also a candidate if you've had a Coronary Artery Calcium CT score of 100 or more, or if you are age 70+.

Take steps to reduce your risk of stroke and vascular disease.  
Call to schedule your Peripheral Vascular and Stroke Screening.
